

Synthetic Patient Record

DEMO DATA - This fictional record is only for testing the RAG application. It does not contain real patient information and is not medical advice.

Patient	Vibhor Mehta	Record ID	DEMO-VIBHOR-002
Age	29 years	Visit date	19 September 2026
Diagnosis	Malaria	Status	Stable; treatment started

Clinical Summary

Vibhor presented with intermittent high fever, chills, sweating, headache, and body aches. A malaria test was positive, and the clinician recorded uncomplicated malaria as the diagnosis.

Reported Symptoms

Episodes of fever with chills followed by sweating, headache, muscle aches, weakness, and mild nausea. No breathing difficulty, seizure, or altered consciousness was reported in this fictional visit.

Investigations

The malaria rapid diagnostic test was positive. A complete blood count was requested to monitor haemoglobin and platelet levels during recovery.

Care Plan

Take the prescribed antimalarial course exactly as directed, drink adequate fluids, and rest. Follow up in two days. Seek urgent care for persistent vomiting, breathing difficulty, seizure, confusion, fainting, or inability to drink fluids.
